SUPPLEMENTAL INFORMATION DISCLOSURE STATEMENT

Date: April 7, 2006

Sir:

Pursuant to 37 C.F.R. §§ 1.97 and 1.98, applicant(s) hereby submit(s) a Supplemental Information Disclosure Statement for consideration by the Examiner.

The filing of this Supplemental Information Disclosure Statement shall not be construed as an admission that the information cited in the statement is, or is considered to be, material to patentability as defined in 37 C.F.R. §1.56(b).

I. LIST OF PATENTS, PUBLICATIONS OR OTHER INFORMATION

The patents, publications or other information submitted for consideration by the Office are listed on PTO-1449, attached hereto.

- a. ☒ Submitted herewith is a legible copy of (i) foreign patent; (ii) each publication or that portion which caused it to be listed; and (iii) all other information or that portion which caused it to be listed.

III. CONCISE EXPLANATION OF THE RELEVANCE
(check at least one box)

- a. ☐ Except as may be indicated below in (b), all of the patents, publications or other information are in the English language or were cited in an English language Search Report, a copy of which is attached hereto (concise explanation not required).
- b. ☒ A concise explanation of the relevance of all patents, publications or other information listed that is not in the English language is as follows:

Electric Mixer

Electric mixers for the circulation and homogenization of liquid manure and other liquids comprise an electric motor (9), which can be used below the liquid level (27) and via which a mixer propeller or a mixer screw (13) can be driven with or without a downstream gear (11). For this purpose, conventionally, only a submersible motor drive can be used. A more cost-effective electric mixer, which can also be operated in liquid and at the same time is easy to handle, consists of a standard electric motor (9) for liquid-free use without a watertight housing (33), which motor is disposed in a liquid-tight protective casing housing (15) and which can therefore be lowered into the liquid. Another cooling medium can be supplied via inflow and return pipes (29, 23) in order to cool the electric motor (9). The electric mixer is suitable for the circulation and homogenization particularly of liquid manure, but also of other liquids, for example warmed and hot liquids.

DE 198 45 545 A1
Agitator with Submersible Motor

An agitator with a submersible motor is provided with a guiding device extending vertically into a basin, for the purpose of guiding a housing of the submersible motor, and with a propeller arrangement mounted on a drive shaft. The drive shaft of the propeller and the shaft of the submersible motor are disposed substantially parallel to each other and preferably superposed. The two shafts are mutually linked by a chain or belt drive for driving purposes. The housing comprises at least three sections, the first of which contains the propeller drive shaft, while the second section contains the submersible motor. The third section contains the chain or belt drive, while the third section defines a rear wall, which extends substantially parallel to the guiding device.

Apparatus for Stirring, Aerating and Pumping off Liquids

Apparatuses for stirring, aerating and pumping off liquids comprise a pump, a submersible motor for driving the pump, at least one mixing chamber downstream of the pump, at least one ejector leading out of the mixing chamber and an ascending pipe, connected to the mixing chamber. In order to simplify the apparatus required for the overall operation of stirring, aerating and pumping off liquids significantly, a conventional submersible aerator is provided with a shut-off device (13), by means of which the passage through the ejector (11) can be optionally shut off during the operation of the pump (2), while at the same time the connection from the pump to the ascending pipe (1) remains free. As a result of this measure, the submersible aerator is additionally assigned the pumping-off function, in addition to its stirring and aerating functions. If the passage through the ejector (11) is blocked, the pump (2) delivers the liquid upwards through the ascending pipe (1), through which normally air is taken in and mixed in the mixing chamber with the liquid jet (Fig. 1).
